Terrà un seminario dal titolo:

“Return time complexity of Sturmian sequences”

Abstract

The Sturmian sequence has the lowest subword complexity besides periodic sequences.
Let $R_n(x)$ be the recurrence time of initial n -word of an infinite sequence x .
We have that x is periodic if and only if there is M such that $R_n(x) \leq n$ for all $n > M$.
Therefore, for nonperiodic sequences $R_n(x) \leq n+1$ is the possible lowest upper bound for R_n .
We show that if $R_n(x) \leq n+1$ for all n , then x is a Sturmian sequence.
In general, the opposite does not hold and we completely classify the such Sturmian sequences.

Tutti gli interessati sono invitati a partecipare.
