Terrà un seminario dal titolo:

“Grothendieck's section conjecture and zero-cycles on varieties”

Abstract

For a connected variety over a field k the \'etale fundamental group of X comes equipped with a projection onto the absolute Galois group of k . According to the widely open Section Conjecture of Grothendieck, in the case of a smooth proper curve of genus at least 2 over a number field conjugacy classes of sections of this projection should correspond to rational points on X .

In the first part of the lecture I shall give an introduction to the \'etale fundamental group and the Section Conjecture, and afterwards I shall present some recent results obtained jointly with D. Harari. In particular, I shall show that there exist curves for which there are sections for the projection over each completion of the number field k but not over k .

Tutti gli interessati sono invitati a partecipare.
